| Surname | |
| Given Name | |
| Student Number | |

This exam consists of 4 questions (10 pages including this page) worth a total of 100%. It is an open book exam, course notes and any MatLab book(s) are allowed. All answers are to be written in this booklet. Scrap work may be done on the back of each page; this will not be marked. No laptops or cell phones are allowed. The exam is 50 minutes long and comprises 20% of your final mark. Please print your full name and student number in the space provided above before you start this exam.

Professor: John Barron

(40%) Consider the following MatLab matrices A, B and C:

```
A= [10 15 16 18;  
    90 28 12 13;  
    41 23 15 59];  
B=[1 2 3; 0 0 0; 3 2 1];  
C=[1; 2; 3];
```

1. (4%) Using the original A above, if $A(3:4,4:5)=\text{eye}(2,2)$ what is the value of A?
2. (4%) Using the original A above, if $A(2:3,:)=\text{flipud}(A(2:3,:))$ what is the value of A?
3. (4%) What is $B*B$:

4. (4%) What is $\mathbf{B} \cdot \mathbf{B}$:

5. (4%) What is the value of $[\mathbf{B}; \mathbf{C}]$?

6. (4%) What is the value of $[\mathbf{C}; \mathbf{C}]$?

7. (4%) Consider a 3 element column vector \mathbf{s} . How would you solve the system of equations $\mathbf{B} \cdot \mathbf{s} = \mathbf{C}$, where \mathbf{B} and \mathbf{C} are as above? Do not try to solve this system of equations!!!

8. (4%) What happens when we execute $(B * C)'$?
9. (4%) What happens when we execute $(C * B)'$?
10. (4%) Using the original 3×4 array A , what is the value of $\text{reshape}(A, 4, 3)$?

(2) (15%) This is the Lab question.

1. (5%) Consider the following expression: $6-5+4*3/2^1$. Write this expression with parentheses to reflect the precedence of the operators. What is the value of the expression?

Parenthesized expression and its value:

2. (10%) Consider the follow graph.

Figure 1: $y = x.^2$ for $x \in [-10, 10]$.

Give the MatLab to plot this graph. Label the x and y axes in the colours shown and usng fontsize 18. Show the title printed in the colour shown with fontsize 24. Note that in order to prevent \wedge from being interpreted as a superscript you must backslash it, i.e. `\wedge`, in a chanacter string in MatLab.

Answer:

(3) (25%) This question is related to Assignment 2 in that it is about the use **circshift** and convolution. Suppose we want to compute 1st order derivatives, Y_X , using a 4-point central difference **mask** with values $[1 \ -8 \ 0 \ 8 \ -1]/12$. Consider applying this row vector mask to a grayvalue image Y .

1. (3%) What is the MatLab statement for applying **mask** to image Y using **imfilter** to compute Y_X , where the output image Y_X is the same size as the input image Y ? (We refer to this solution as Y_{X1} later.)
2. (7%) If a vectorized solution for Y_X is required, show the **circshift** statements required and the vectorized calculation required on them to get Y_X (we refer to this solution as Y_{X2} later):

3. (3%) What is the MatLab statement for applying **mask** to image Y using **imfilter** to compute Y_Y , where the output image Y_Y is the same size as the input image Y ? Note that the mask values must be applied vertically. (We refer to this solution as Y_{Y1} later.)

4. (7%) If a vectorized solution for Y_Y is required, show the **circshift** statements required and the vectorized calculation required on them to compute Y_Y (we refer to this solution as Y_{Y2} later).

5. (5%) How and where do Y_{X1} and Y_{X2} and Y_{Y1} and Y_{Y2} differ from each other?

Y_{X1} and Y_{X2} :

Y_{Y1} and Y_{Y2} :

(4) (20%) Consider the following row vector $Q=[1 \ 2 \ 3 \ 4 \ 5 \ 6 \ 7 \ 8 \ 9]$;

1. (5%) What does $L=Q+3<8$?

2. (5%) What does $C=\text{find}(Q+3<8)$ print?

3. (5%) What does $\text{size}(Q)$ print?

4. (5%) What does $\text{sum}(L(:))$ compute?

2016 Midterm Statistics

=====

average for all registered students (including thos who did
not write exam): 59.48

average just for those who wrote exam: 70.50
